

Abstract

A system for on-line viewing of an event at an event site includes a central site connected to a network, and a plurality of cameras disposed about an event site. The 5 cameras provide views of the event site from at least two different camera angles and provide video feeds to the central site via the network. Viewing means enable a user to access the central site and to selectively view the event site by means of at least two of the plurality of cameras. Methods of viewing the event, and systems and methods for recording the event so viewed, are also provided.
